ESSENTIALS

Talaria Score

Talaria Score gauge ring (0-100) with zone coloring

PURPOSE
A single 0-100 composite health score combining profitability, risk management, consistency, and discipline into one number the trader can track over time.

HOW IT WORKS

- Computed as 0.30·Profitability + 0.30·Risk + 0.20·Consistency + 0.20·Discipline.
- Each sub-score is normalized to 0-100 from its underlying metrics.
- Color zones: 0-40 red (Needs Work), 41-70 gold (Developing), 71-100 green (Strong).
- A tier sublabel is derived from the score (Developing / Proficient / Strong / Elite) for a motivational hook — replaces last year's separate star-rating, which would have competed with the score.
- Double-click opens a breakdown explaining what is pulling the score up or down.

DATA REQUIRED

- Per-trade pnl, R-multiple, rulesFollowed flag
- Session profit factor, max drawdown, % profitable weeks
- Std dev of returns for consistency term

BENEFIT
Gives a trader (and their mentor) an instant, trackable read on overall trading health without interpreting a dozen separate metrics. The branded score is unique to Talaria.

ESSENTIALS

Sub-Score Breakdown

ESSENTIALS

Strategy Radar

- STANDARD
- PROP FIRM
- LIVE JOURNAL
- STRATEGY (MERGED)

Six-axis radar of the strategy profile

PURPOSE
The strategy scored on six axes at once — Profitability, Consistency, Risk Control, Frequency, Discipline, Edge — drawn as a single shape. A visual companion to the Talaria Score.

HOW IT WORKS

- Each axis runs 0 (center) to 100 (outer ring).
- The filled blue polygon is the strategy's profile; a balanced strategy fills the shape evenly.
- Dents reveal weak dimensions at a glance (e.g. a spike on Profit but a dent on Consistency = lucky, not robust).

DATA REQUIRED

- The six sub-scores already computed for the Talaria Score
- Frequency from trade count vs period length

BENEFIT
Turns six separate numbers into one recognizable shape the trader can track over time. A shrinking polygon on one axis is an early warning that one dimension of the edge is degrading.

ESSENTIALS

KPI Strip

Eight KPI cards with inline visuals (4×2 grid)

PURPOSE
The at-a-glance headline strip: 8 critical metrics each with a small supporting visual (sparkline, dot trail, progress bar, mini box plot) rather than a bare number.

HOW IT WORKS

- 8 cards in a 4×2 grid, all the same height tier.
- Each card pairs the large number with a small visual giving context.
- Day Win % counts profitable trading days, distinct from trade win rate.
- Click any card to expand a 1-year history sub-window.

DATA REQUIRED

- Per-trade pnl, R-multiple, outcome, openTime/closeTime
- Session starting/current balance, max drawdown

BENEFIT
Lets a trader assess a session in seconds. The visuals add context a number alone cannot — e.g. a 58% win rate with a clustered loss dot-trail tells a very different story than an evenly distributed one.

ESSENTIALS

Quant KPI Strip

ESSENTIALS

Equity Curve

Equity line with drawdown shading, peak line, and trade markers

PURPOSE

The account balance after each trade, color-coded by gain/loss, with drawdown shading and trade markers. The single most-looked-at chart in the dashboard.

HOW IT WORKS

- Line is green on rising segments, red on falling segments.
- Red shaded area between the running-peak line and equity shows drawdown depth.
- Dots mark individual trades; hover reveals trade #, pair, RR, PnL.
- Tabs switch to Cumulative P&L; / Returns % / Rolling 30-trade / vs Buy & Hold / vs Random.
- Granularity selector (Daily / Weekly / Monthly / Quarterly / Yearly) plus chart-type (Area/Line) and accumulation (Cumulative/Per-period) toggles — adopted from last year's Portfolio Growth controls.

DATA REQUIRED

- session.equity_curve[] array
- Per-trade pnl, pair (for marker coloring), timestamps
- Optional benchmark series for vs Buy & Hold overlay

BENEFIT

Shows the shape of performance, not just the endpoints. Drawdown shading reveals how much pain preceded the gains; the vs Random overlay tells the trader whether their edge beats luck.

ESSENTIALS

Cumulative R Curve

- STANDARD
- PROP FIRM
- LIVE JOURNAL
- STRATEGY (MERGED)

Running sum of per-trade R-multiples

PURPOSE

The running sum of every trade's R-multiple outcome. The cleanest single picture of whether edge is accumulating, independent of position sizing or account balance.

HOW IT WORKS

- Each trade adds its R result to the running total.
- A steadily rising line = consistent positive expectancy; a flat or falling line = no edge.
- Unlike the dollar equity curve, this is immune to sizing changes — pure edge.

DATA REQUIRED

- Per-trade `actual_rr_net` (R-multiple outcome)

BENEFIT

Strips away money management to show the raw edge. Two traders with identical strategies but different sizing have different equity curves but the same cumulative-R curve — making this the honest measure of whether the system itself works.

ESSENTIALS

Drawdown

Underwater drawdown curve with max-DD marker

PURPOSE

The underwater equity curve: how far below the running peak the account is at every point, plus max drawdown and recovery time.

HOW IT WORKS

- Zero line at top = at peak equity.
- Red filled area dips down to show each drawdown's depth and duration.
- Headline stats: max drawdown %, average recovery time in trades, worst recovery.

DATA REQUIRED

- Per-trade pnl to compute running peak and equity
- Trade timestamps for recovery-duration measurement

BENEFIT

Drawdown duration matters as much as depth. A 10% drawdown that took 60 trades to recover is a different risk than one recovered in 8 — this view exposes both, which a plain equity curve hides.

ESSENTIALS

Win / Loss Distribution

Win/Loss/Breakeven donut with center win rate

PURPOSE
The split of outcomes — wins, losses, breakevens — as a donut with the win rate in the center and a legend with counts.

HOW IT WORKS

- Donut segments sized by count: green wins, red losses, grey breakevens.
- Center shows headline win rate %.
- Legend lists exact counts per outcome.

DATA REQUIRED

- Per-trade outcome flag (win / loss / breakeven)

BENEFIT
The fastest possible read on hit rate. Combined with average win/loss size elsewhere, it anchors the trader's understanding of how their edge is structured.

ESSENTIALS

Balance Waterfall

Balance journey broken into wins, losses, and fees

PURPOSE
How the account got from its starting balance to its ending balance, broken into gross wins, gross losses, commission, and swap as stacked descending/ascending bars.

HOW IT WORKS

- First and last bars (blue) are the start and end balances.
- Green bar = total gross profit added; red bars = gross losses, commission, swap subtracted.
- Connector lines trace the running total between bars.

DATA REQUIRED

- Aggregated gross profit, gross loss, total commission, total swap
- Starting and ending balance

BENEFIT
Makes costs visible. Most traders never separate commission and swap from their P&L; seeing that fees consumed a chunk of gross profit is often the most actionable insight in the whole dashboard — especially for high-frequency prop firm traders on thin margins.

ESSENTIALS

Performance Calendar

PURPOSE
A single hour-of-day × day-of-week grid where cell color shows P&L; intensity. Replaces separate 'time of day' and 'day of week' cards.

HOW IT WORKS

- Rows = hours of day, columns = days of week.
- Green cells = profitable windows, red = losing windows; intensity = magnitude.
- Click any cell to filter the whole dashboard to that time slice.

DATA REQUIRED

- Per-trade openTime (hour + weekday), pnl

BENEFIT
Reveals the trader's best and worst windows instantly. Most traders have a 'golden hour' they cannot articulate until they see it here — then they can build a filter that only trades it.

Hour × day P&L; heatmap

ESSENTIALS

Daily P&L; Heatmap

6-week daily P&L; calendar

PURPOSE
A 6-week × 7-day calendar grid where each cell is one trading day, colored by that day's net P&L;

HOW IT WORKS

- Each cell = one day; green = up day, red = down day.
- Cell can show trade count inside.
- A weekly-total column on the right sums each row (e.g. Week 1 +\$10.0K, Week 4 -\$4.0K) — adopted from last year's calendar.
- For Prop Firm source, a red cell border flags days that approached a rule limit.

DATA REQUIRED

- Per-trade openTime (date), pnl
- For Prop Firm: daily loss limit utilization

BENEFIT
Shows consistency at a glance — a wall of mixed green/red reveals choppiness, while clean green stretches show stability. The Prop Firm border warnings flag near-breach days a plain curve would hide.

ESSENTIALS

Performance by Instrument / Session / Day

PURPOSE
Horizontal bar breakdowns ranking profitability by instrument, by session, and by day of week — each row showing P&L, trade count, and win rate together.

HOW IT WORKS

- One horizontal bar per category, green right / red left from a zero line.
- Each row labels the category plus its \$ P&L; and win rate.
- Three variants share the layout: by instrument, by session, by weekday.

DATA REQUIRED

- Per-trade symbol, session tag, weekday, pnl, outcome

BENEFIT
Turns 'I think I trade gold well' into 'XAUUSD: +\$1,230 over 40 trades at 58%.' Lets the trader cut instruments or sessions that quietly lose money.

ESSENTIALS

Instrument Bubble

STANDARD

PROP FIRM

LIVE JOURNAL

STRATEGY (MERGED)

Symbols by win rate x expectancy, sized by volume

PURPOSE

Every traded symbol plotted by win rate (x-axis) and expectancy (y-axis), with bubble size equal to trade count. One chart that says which instruments deserve focus and which to cut.

HOW IT WORKS

- Top-right = high win rate and high expectancy: your best instruments.
- Below the dashed expectancy-zero line (red bubbles) = losing instruments.
- Bigger bubbles = more trades, so a large bubble below the line is a serious leak.

DATA REQUIRED

- Per symbol: win rate, expectancy (R), trade count

BENEFIT

Collapses three dimensions into one glance. A small high-expectancy bubble means a promising instrument worth trading more; a large negative bubble means a habitual instrument that is quietly draining the account.

ESSENTIALS

Streaks & Records

ESSENTIALS

Consistency

STANDARD	PROP FIRM	LIVE JOURNAL	STRATEGY (MERGED)
----------	-----------	--------------	-------------------

Rolling Sharpe with threshold zones

PURPOSE

Surfaces the consistency metrics retail traders rarely see: Sharpe (shown as a Consistency Score), % profitable weeks, weekly std dev, and return-to-drawdown across windows.

HOW IT WORKS

- Rolling Sharpe line plotted against poor / good / excellent threshold zones.
- Companion stats: % profitable weeks, weekly return std dev, R/D ratio at 7/30/180/365 days.

DATA REQUIRED

- Per-trade returns time series
- Weekly aggregation of returns
- Rolling drawdown for R/D ratios

BENEFIT

Separates a lucky run from a real, repeatable edge. A high Sharpe with stable rolling values is the signature of a robust strategy; a spiky one warns of fragility.

ESSENTIALS

Trade Journal

Journal rows with inline per-trade equity sparklines

PURPOSE

The trade-by-trade log. Each row carries a mini equity sparkline showing that trade's MAE/MFE path inline, plus a rule-adherence indicator.

HOW IT WORKS

- Table rows: date, symbol, side, R, P&L, exit reason, tags.
- Each row embeds a tiny equity curve of the trade's excursion.
- Rule-adherence dot: green (all followed), gold (optional missed), red (invalidator hit).
- Hovering a row highlights that trade on the main equity curve.

DATA REQUIRED

- Per-trade all scalar fields + `bar_close_r[]` for the sparkline + `rulesFollowed`

BENEFIT

Brings excursion context to the row level — the trader sees a trade's shape without opening anything. The rule dot ties each trade back to the strategy builder.

ESSENTIALS

Best & Worst Trades

STANDARD

PROP FIRM

LIVE JOURNAL

BEST & WORST TRADES

TOP 5 WINNERS

USDJPY	+5.2R	\$1,240	FVG
XAUUSD	+4.1R	\$980	MSS
EURUSD	+3.8R	\$910	OB
GBPUSD	+3.1R	\$740	FVG
AUDUSD	+2.9R	\$610	Breaker

TOP 5 LOSERS

GBPUSD	-2.0R	-\$480	FOMO
EURUSD	-1.8R	-\$420	Revenge
USDCHF	-1.6R	-\$390	Moved SL
XAUUSD	-1.5R	-\$360	Late
USDJPY	-1.3R	-\$310	News

Top 5 winners and top 5 losers with tags

PURPOSE
The top five winners and top five losers side by side, each with its R-multiple, dollar result, and tag. Surfaces what the outlier trades have in common.

HOW IT WORKS

- Left column ranks the five biggest winners; right column the five biggest losers.
- Each row shows symbol, R-multiple, dollar P&L, and the dominant tag.
- Tags on the losers column often reveal the behavioral leak (FOMO, Revenge, Moved SL).

DATA REQUIRED

- Per-trade: symbol, actual_rr_net, pnl_dollars_net, dominant tag
- Sort by R-multiple to rank

BENEFIT
Outliers drive most of a strategy's results. Seeing that the biggest losers are all tagged 'FOMO' or 'Revenge' — while the biggest winners share a clean setup tag — points straight at what to repeat and what to eliminate.

ESSENTIALS

Performance Highlights

Auto-detected best setup / instrument / time / day

PURPOSE
A slim always-visible insight strip on the landing view surfacing 3-4 plain-language highlights: Best Setup, Most Profitable Instrument, Best Time of Day, Best Day of Week — each with win rate, trade count and P&L.; (Adopted from last year's build; shares detection logic with the Edge Finder.)

HOW IT WORKS

- Auto-detected from the filtered trade set, refreshed on every filter change.
- Each highlight is a chip: headline + win rate + trade count + P&L.;
- Clicking a chip jumps to the Edge Finder page for the full pattern.
- Gives immediate value on the landing view without navigating to Edge Finder.

DATA REQUIRED

- Computed: best subgroup by P&L; across setup / instrument / hour / weekday (min sample 20)
- Shares the edgeFinderInsights detection so the two never disagree

BENEFIT
Most traders never articulate where their edge actually lives. Putting the three biggest strengths on the landing view, in plain language, makes the dashboard feel like a coach from the first second — and pulls them toward the deeper Edge Finder analysis.

EXCURSION (MAE / MFE)

Session Stat Cards (7)

PURPOSE
The seven session performance cards from the design spec: BALANCE, NET PnL, WIN RATE, PROFIT FACTOR, EXPECTANCY, MAX DD, COMMISSION. Grouped on one page since they share an identical card structure.

HOW IT WORKS

- BALANCE green if > start else red. NET PnL signed.
- WIN RATE gold; PROFIT FACTOR green if >1 else red.
- EXPECTANCY = mean actual_rr_net; MAX DD always red; COMMISSION orange.
- All recompute live with the global filters (pair / result / setup / gross-net).

DATA REQUIRED

- session.current_balance, starting_balance, max_drawdown_dollars
- Per-trade pnl_dollars_net, actual_rr_net, commission_total

BENEFIT
The numeric backbone of the session view. Grouping all seven keeps them visually consistent and avoids seven near-identical pages.

Seven session stat cards (BALANCE ... COMMISSION)

EXCURSION (MAE / MFE)

Excursion Stat Cards (7)

Seven excursion stat cards (AVG MAE ... RECOVERY)

EXCURSION (MAE / MFE)

What-If Bars

STANDARD	PROP FIRM	LIVE JOURNAL	STRATEGY (MERGED)
----------	-----------	--------------	-------------------

Three what-if bars with gap arrows

PURPOSE

Three bars contrasting what the trader actually captured versus what was available during the trade and in total, with the gaps annotated.

HOW IT WORKS

- Bar 1 (gold) = avg actual RR for winners ('what you got').
- Bar 2 (cyan) = avg MFE during trade ('available during').
- Bar 3 (orange) = avg total MFE incl. post-exit ('available total').
- Red arrow = management gap (bar1→bar2); orange arrow = exit-timing gap (bar2→bar3).

DATA REQUIRED

- Per-trade actual_rr (winners), mfe_r, total_mfe_r

BENEFIT

Makes 'leaving money on the table' literal and visual. A large management gap means exits are early; a large exit gap means the move continued after exit — two different fixes.

EXCURSION (MAE / MFE)

Capture Ratio Histogram

Five-bucket capture efficiency histogram

PURPOSE
The distribution of capture efficiency across winning trades, bucketed 0-100% and colored worst-to-best.

HOW IT WORKS

- Five buckets: 0-20 / 20-40 / 40-60 / 60-80 / 80-100%.
- Colored red→orange→gold→green→teal worst to best.
- Bar height = count of winners in each bucket; count labelled on top.
- `capture_ratio` per winner = `actual_rr_net` / `total_mfe_r` × 100.

DATA REQUIRED

- Per-trade `actual_rr_net` and `total_mfe_r` for winners

BENEFIT
Shows whether the trader consistently captures most of the available move or routinely exits early. A left-skewed histogram (low capture) flags a systemic exit problem.

EXCURSION (MAE / MFE)

Post-Exit MFE Curve

STANDARD	PROP FIRM	LIVE JOURNAL	STRATEGY (MERGED)
----------	-----------	--------------	-------------------

Post-exit MFE for winners vs losers with plateau line

PURPOSE
How much further price moved after the trade exited, averaged across winners (green) and losers (red), with the plateau point marked.

HOW IT WORKS

- X = bars after exit (0-50); Y = average additional MFE in R from exit.
- Two filled lines: winners and losers.
- Dashed gold vertical = plateau (where the curve flattens) — the natural exit point.

DATA REQUIRED

- Per-trade post-exit path (bar_close_r from exit index onward)

BENEFIT
Answers 'should I hold longer?' If the curve keeps climbing well past exit, the trader is leaving move behind; if it plateaus right at exit, their timing is already good.

EXCURSION (MAE / MFE)

Post-Exit MFE by Setup

Per-setup post-exit MFE lines

PURPOSE
One post-exit MFE line per setup type (winners only), revealing which setups keep running after exit and which top out immediately.

HOW IT WORKS

- One colored line per setup: FVG green, OB cyan, Breaker orange, MSS purple, IFVG gold.
- Steepest curve = hold longer on that setup; flattest = TP already optimal.

DATA REQUIRED

- Per-trade setup_tag + post-exit path, winners only

BENEFIT
Setup-specific exit guidance. The trader learns to hold FVG trades longer but take Breaker profits quickly, instead of applying one exit rule to everything.

EXCURSION (MAE / MFE)

MAE Distribution

PURPOSE
How deep trades go against the trader before resolving, stacked winners (green) over losers (red) per MAE bucket.

HOW IT WORKS

- Buckets 0-0.2R ... >1.2R; stacked winners then losers.
- The bucket where green bars stop ≈ the optimal stop-loss boundary.

DATA REQUIRED

- Per-trade mae_r and outcome

BENEFIT
Reveals stop placement. If winners rarely exceed 0.6R MAE but the stop sits at 1.5R, the trader is risking 2-3× more than necessary — a direct, quantified fix.

Stacked MAE distribution (winners vs losers)

EXCURSION (MAE / MFE)

MFE Distribution

EXCURSION (MAE / MFE)

During vs Total MFE Scatter

Scatter of during-trade vs total MFE with diagonal

PURPOSE

Each trade plotted by its during-trade MFE (x) against its total MFE including post-exit (y). Points above the diagonal had move left after exit.

HOW IT WORKS

- Diagonal $y = x$ = exit captured the full move.
- Dots above the line = additional move occurred after exit.
- Circle = winner, X = loser; hover for trade details.

DATA REQUIRED

- Per-trade mfe_r and total_mfe_r

BENEFIT

Quantifies post-exit opportunity per trade. A cloud sitting well above the diagonal means consistently early exits — a systematic, fixable pattern.

EXCURSION (MAE / MFE)

MAE vs MFE Scatter

STANDARD	PROP FIRM	LIVE JOURNAL	STRATEGY (MERGED)
----------	-----------	--------------	-------------------

MAE vs MFE scatter with outcome coloring

PURPOSE

Every trade plotted by how far it went against (MAE) versus in favor (MFE). Winners cluster bottom-right, losers top-left.

HOW IT WORKS

- X = MAE, Y = MFE; green winners, red losers.
- Diagonal reference shows the boundary of ideal exits.
- Filterable by All / Wins / Losses / by pre-trade tag / by post-trade tag.

DATA REQUIRED

- Per-trade mae_r, mfe_r, outcome, tags

BENEFIT

The master excursion picture. The position of the clouds tells the trader at a glance whether their problem is entries (losers with low MFE) or exits (winners with high unrealized MFE).

EXCURSION (MAE / MFE)

Trade Path Cloud

PURPOSE
All trades overlaid as faint normalized paths from entry through post-exit, with thick median lines and percentile bands for winners and losers.

HOW IT WORKS

- X normalized: 0-50 during trade, 50-100 post-exit; Y in R from entry.
- Thin green (winners) / red (losers) lines; thick lines = medians.
- Dashed gold vertical at bar 50 = exit; faint orange tint = post-exit zone.

DATA REQUIRED

- Per-trade `bar_close_r[]` resampled to 50 points + post-exit portion

BENEFIT
Shows the typical 'shape' of a winning vs losing trade. If losers go against the trader immediately while winners ramp slowly, entry timing and patience are the levers.

EXCURSION (MAE / MFE)

Box Plots at Key Moments

PURPOSE
Distribution box plots at six stages of the trade lifecycle (MAE, MFE, Exit, Post+10/+25/+50) showing how the spread of outcomes evolves.

HOW IT WORKS

- Box = 25th-75th percentile; whiskers = range; diamond = mean.
- Six stages from MAE through post-exit checkpoints.
- Dashed gold divider separates exit from post-exit stages.

DATA REQUIRED

- Per-trade mae_r, mfe_r, exit R, and post-exit checkpoints from bar_close_r[]

BENEFIT
Reveals not just averages but the spread at each stage. Wide post-exit boxes rising above zero (for losers) signal trades that frequently recover after being stopped — a stop-placement insight.

Six-stage box plots across the trade lifecycle

EXCURSION (MAE / MFE)

Setup Comparison

STANDARD	PROP FIRM	LIVE JOURNAL	STRATEGY (MERGED)
----------	-----------	--------------	-------------------

Grouped bars: five metrics per setup type

PURPOSE
A grouped bar chart profiling each setup type across five metrics: MAE, Actual RR, During MFE, Total MFE, and scaled Capture %.

HOW IT WORKS

- One cluster per setup (FVG, OB, Breaker, MSS, IFVG).
- Five colored bars per cluster for the five metrics.
- Capture % scaled to fit the R-multiple axis.

DATA REQUIRED

- Per-trade setup_tag + mae_r, actual_rr, mfe_r, total_mfe_r, capture_ratio

BENEFIT
Lets the trader compare their setups side by side and concentrate on the ones with the best excursion profile, dropping setups that consistently underperform.

EXCURSION (MAE / MFE)

Losers Recovery Rate

PURPOSE
Per setup, the share of losing trades that would have recovered to a win within the post-exit window — a stop-tightness diagnostic.

HOW IT WORKS

- Red back bar = total losers per setup; orange front bar = losers that would have won.
- % label = recovery count / total losers.
- would_have_won = post-exit MFE from entry $\geq$ planned RR $\times$ 0.5.

DATA REQUIRED

- Per-trade setup_tag, would_have_won flag, post-exit path

BENEFIT
High recovery % for a setup means the stop is too tight there — the trader is being shaken out of trades that go on to work. A direct, per-setup stop adjustment.

Per-setup losers recovery rate bars

EXCURSION (MAE / MFE)

Per-Instrument Breakdown Table

	STANDARD	PROP FIRM	LIVE JOURNAL	STRATEGY (MERGED)
PER-INSTRUMENT — visual summary				
AUDUSD				\$-180 48%
USDJPY				\$760 55%
GBPUSD				\$-410 44%
XAUUSD				\$1230 58%
EURUSD				\$1840 62%

Per-instrument metrics (shown as visual bars here)

PURPOSE

A table with one row per traded pair plus a totals row: trades, win rate, net P&L; avg RR, avg MAE, avg MFE, capture %, and commission.

HOW IT WORKS

- One row per pair, colored by the pair's accent.
- Columns: trades, win rate, net PnL, avg RR, avg MAE, avg MFE, capture %, commission.
- Totals row aggregates the session.

DATA REQUIRED

- Per-trade pair, outcome, pnl, actual_rr, mae_r, mfe_r, capture_ratio, commission

BENEFIT

The precise per-instrument numbers behind the visual breakdowns — useful for traders who want exact figures to decide which instruments to keep or cut.

EXCURSION (MAE / MFE)

Trade Duration Analysis

STANDARD

PROP FIRM

LIVE JOURNAL

STRATEGY (MERGED)

P&L; / count / win-rate across shared duration buckets

PURPOSE

Three linked bar charts sharing one duration-bucket scale (1-2m through 4h+): P&L; by duration, trade count by duration, and win rate by duration. (Refined from last year's most-polished page.)

HOW IT WORKS

- Buckets: 1-2m / 2-5m / 5-10m / 10-30m / 30m-1h / 1-2h / 2-4h / 4h+.
- Top panel: P&L; per bucket (green positive, red negative).
- Middle: trade count per bucket. Bottom: win rate per bucket. Median + average reference lines on each.
- Reveals the holding-time sweet spot — e.g. 'I make money on 2-4h holds and bleed on sub-10m scalps.'

DATA REQUIRED

- Per-trade: openTime, closeTime (duration), pnl_dollars_net, outcome

BENEFIT

Most traders have a duration band where their edge lives and bands where they leak. Seeing P&L;, frequency, and win rate on the same buckets at once isolates that band immediately and argues for a minimum/maximum hold rule.

Expectancy Heatmap

WHAT-IF SIMULATOR

Simulated vs Actual Equity

STANDARD

PROP FIRM

LIVE JOURNAL

STRATEGY (MERGED)

SIMULATE vs ACTUAL EQUITY

*Actual vs simulated equity with shaded gap*

PURPOSE

Overlays the actual equity curve (solid cyan) against a simulated one (dashed gold) using new TP/SL levels, with the gap shaded.

HOW IT WORKS

- Solid cyan = real equity; dashed gold = simulated under chosen TP/SL.
- Gap shaded green if simulation beats actual, red if worse.
- Recalculates whenever the heatmap selection or sliders change.

DATA REQUIRED

- `session.equity_curve[]` + per-trade excursion arrays for the simulation

BENEFIT

Translates a TP/SL change from abstract expectancy into a concrete dollar curve, so the trader sees exactly what a rule change would have done to the account.

WHAT-IF SIMULATOR

TP/SL Optimizer (Excursion Bars)

Excursion bars with draggable TP/SL lines

PURPOSE
An interactive per-trade excursion chart with draggable TP and SL lines. Each bar shows a trade's MAE, MFE, total MFE, and actual exit; dragging the lines re-simulates every trade live.

HOW IT WORKS

- Per trade: green bar up to MFE, faded orange to total MFE, red bar down to MAE, exit tick.
- Gold line = simulated TP, red line = simulated SL — both draggable.
- A live stats panel updates win rate, avg winner/loser, expectancy, profit factor, \$ impact.
- Trades that flip outcome under the new levels flash.

DATA REQUIRED

- Per-trade `bar_high_r[]`, `bar_low_r[]`, `mae_r`, `mfe_r`, `total_mfe_r`, `exit R`

BENEFIT
The most hands-on optimization tool: the trader literally drags their stop and target and watches every historical trade re-resolve, finding the levels that would have maximized expectancy.

WHAT-IF SIMULATOR

Planned vs Actual Discipline

PURPOSE
A discipline panel contrasting what the trader planned with what they executed: TP/SL modification rates, planned vs actual RR, discipline gap, and avg risk per trade.

HOW IT WORKS

- Scatter: planned RR (x) vs actual RR (y) per trade against a y=x line.
- Stat panel: TP/SL modification rate, avg planned RR, avg actual RR, discipline gap, avg risk %.
- Dots below the line = executed worse than planned.

DATA REQUIRED

- Per-trade planned_rr, actual_rr_net, sl_tp_modifications[], planned_risk_pct

BENEFIT
Quantifies execution slippage: 'planned 2.0R, realized 1.3R — 35% lost to early exits and stop moves.' Tells the trader whether the leak is the plan or the execution.

Planned vs actual R:R with discipline stats

WHAT-IF SIMULATOR

Advanced Management Stats

Six advanced management ratios

PURPOSE
A stats panel on advanced trade management: multi-entry usage, fill rates, multi-TP usage, breakeven triggers, and trailing-stop activation.

HOW IT WORKS

- Multi-entry trades and all-entries-filled rate.
- Multi-TP usage; BE triggered / stopped-at-BE; trail activated — each as a ratio of the enabled set.

DATA REQUIRED

- Per-trade num_entries, partial_exits[], be_triggered, be_enabled, trail_activated, trail_enabled

BENEFIT
Reveals whether sophisticated management features are actually helping. E.g. a high 'stopped at BE' rate may mean breakeven stops are triggering too early and cutting winners.

STATISTICAL

R-Multiple Distribution

R-multiple histogram with mean line

PURPOSE
The histogram of trade outcomes in R-multiples, with reference lines for mean, median, and the R implied by win rate.

HOW IT WORKS

- Buckets from <-2R to >3R, red for losses, green for wins.
- Dashed gold mean line; cumulative R curve can overlay.
- Click a bar to drill into trades in that bucket.

DATA REQUIRED

- Per-trade actual_rr_net

BENEFIT
Shows the shape of edge. A right-skewed distribution (a few large wins) is fragile; many modest wins is robust. The mean line confirms whether expectancy is genuinely positive.

STATISTICAL

Rolling Metrics

Rolling metric with threshold zones

PURPOSE
A rolling-window line (Sharpe, win %, expectancy, or profit factor) plotted against poor/good/excellent threshold zones.

HOW IT WORKS

- Selectable metric, window size 30/60/90 trades.
- Green/gold/red zone shading for quick interpretation.

DATA REQUIRED

- Per-trade returns/outcomes time series

BENEFIT
Catches drift the headline numbers hide. A strategy whose rolling Sharpe is sliding from green toward red is losing edge even if its all-time stats still look fine.

STATISTICAL

Monte Carlo & Pass Probability

- STANDARD
- PROP FIRM
- LIVE JOURNAL
- STRATEGY (MERGED)

Monte Carlo paths with percentile envelope and rule lines

PURPOSE
Thousands of simulated future equity paths from the trade distribution, with percentile envelopes and (for Prop Firm) rule lines and a pass probability.

HOW IT WORKS

- Many faint paths + P5/P50/P95 envelope lines.
- For Prop Firm: profit-target and max-DD limit lines overlaid; paths breaching = failures.
- Pass Probability = % of simulated evaluations that pass all rules.
- Scenario sliders (risk %, win rate, avg R) re-run live.

DATA REQUIRED

- Per-trade outcome distribution
- For Prop Firm: rule parameters (daily loss, total DD, target, min days)

BENEFIT
Answers whether the result is edge or luck, and for Prop Firm traders gives the single most important number — the probability of passing a fresh evaluation.

STATISTICAL

Autocorrelation of Returns

PURPOSE
Bar chart of return autocorrelation at lags 1-20 with a 95% confidence band — does one trade's outcome predict the next?

HOW IT WORKS

- Bars at each lag; bars outside the blue CI band are statistically significant.
- Significant positive lag = streaky returns; negative = mean-reverting.

DATA REQUIRED

- Per-trade returns time series

BENEFIT
Tests independence. Significant autocorrelation means outcomes cluster, which changes position-sizing and risk-of-ruin math the trader would otherwise get wrong.

Autocorrelation bars with confidence band

STATISTICAL

Symbol Correlation Matrix

PURPOSE
A grid of pairwise return correlations between traded symbols, green for positive and red for negative.

HOW IT WORKS

- Symmetric matrix; diagonal = 1.0.
- Green = positively correlated, red = negatively correlated.
- Value printed in each cell.

DATA REQUIRED

- Per-symbol return series over overlapping periods

BENEFIT
Reveals hidden concentration risk — trading three highly correlated pairs is effectively one big position. Helps the trader diversify rather than triple down unknowingly.

Symbol return correlation heatmap

STATISTICAL

Win/Loss Runs Test

PATTERNS & BEHAVIOR

Tag Cross-Analysis Matrix

Pre-trade × post-trade expectancy matrix

PURPOSE
The Talaria differentiator: a heatmap intersecting pre-trade tags (rows) with post-trade tags (columns), each cell colored by the expectancy of trades carrying both.

HOW IT WORKS

- Rows = pre-trade conditions (HTF bias, FVG, session...); columns = post-trade behaviors (target hit, exited early, moved SL...).
- Cell color = expectancy of trades with both tags; cell size = trade count.
- Cells with <5 trades shown faint (low confidence).
- Click a cell to see the exact trades.

DATA REQUIRED

- Per-trade preTradeTags[] and postTradeTags[]

BENEFIT
Reveals interactions no single-tag view can. E.g. a strong pre-trade setup combined with 'FOMO Entry' may be a hidden leak, while 'Exited Early' on a great setup may still be net positive. This is the most valuable single view for mentorship.

PATTERNS & BEHAVIOR

Tag Performance Tables

PURPOSE
Side-by-side tables ranking pre-trade and post-trade tags by trade count, win rate, avg R, and total P&L;, with strength/weakness badges.

HOW IT WORKS

- One table for pre-trade tags, one for post-trade tags.
- Sortable columns; green STRENGTH / red WEAKNESS badge vs the overall baseline.
- Rolling win-rate sparkline per tag.

DATA REQUIRED

- Per-trade tags + outcome, pnl, R

BENEFIT
Tells the trader which conditions and behaviors actually make money. 'Trade only with HTF Bias Aligned and expectancy nearly doubles' is the kind of directly actionable finding this surfaces.

Pre/post tag performance (visual summary)

PATTERNS & BEHAVIOR

Variables Analysis

N-way tag-combination ranking by P&L:

PURPOSE

A generalized, N-way version of the Tag Cross-Analysis Matrix. Instead of a fixed pre x post grid, it ranks arbitrary COMBINATIONS of any tagged variable (session, structure, bias, entry model, emotion) by P&L.; (Adopted from last year's strongest idea.)

HOW IT WORKS

- Combination Level selector: Single / Pairs / Triples.
- Minimum-trades filter suppresses small-sample noise.
- Top combinations ranked by P&L; as chained chips + bars; a companion flat table ranks every single variable by Trades / Win% / Avg R / P&L; / Profit Factor / Expectancy.
- A win-rate-vs-P&L; bubble scatter (bubble = trade count) sits alongside.

DATA REQUIRED

- Per-trade: every tagged attribute (preTradeTags, postTradeTags, setupTag, session, regime, custom tags)
- Computed in a Web Worker: cap at triples, require min sample (combinatorial explosion otherwise)

BENEFIT

The Tag Matrix is locked to two dimensions; real traders tag far more than that. This finds the best AND worst combinations across everything, surfacing patterns like 'HTF Bias + FVG + Discount = +\$45K' that a 2-axis view can never reach. Pairs with the matrix as the deep explorer.

PATTERNS & BEHAVIOR

Variables Ranking Table

	STANDARD		PROP FIRM		LIVE JOURNAL		STRATEGY (MERGED)	
VARIABLES — PERFORMANCE RANKING							PURPOSE The flat companion to Variables And Strategies. It's one sortable table, independent of the other two. HOW IT WORKS • One row per variable value (e.g. HTF Bias: taken). • Columns: Trades, Win %, Avg R, P&L, PF, EXP. • Sortable by any column; default sort is Trades. DATA REQUIRED • Per-trade: all tagged attributes + closed price. BENEFIT Before exploring combinations, the flat table shows the edge and which quietly cost money. It's an immediate, actionable finding.	
VARIABLE	TRD	WIN%	AVG R	P&L	PF	EXP		
HTF Bias: taken	554	64.7%	2.36	+\$1.3M	15.9	\$2.7K		
Jolts: REJ	908	63.4%	0.73	+\$684K	2.30	\$1.9K		
Structure: Discount	648	42.7%	0.71	+\$600K	2.23	\$1.8K		
Entry: MSS	492	37.6%	0.51	+\$252K	1.62	\$1.8K		
Seasonality: Bullish	438	42.9%	0.72	+\$314K	2.26	\$1.8K		
Call: Premium	528	38.7%	0.47	+\$248K	1.74	\$1.7K		
Entry: CSD	338	40.8%	0.63	+\$216K	2.07	\$1.8K		
Dxd: NOT taken	1260	20.2%	-0.19	-\$264K	0.76	\$1.4K		

PURPOSE

The flat companion to Variables Analysis: every individual tagged variable ranked in one sortable table, independent of combinations.

HOW IT WORKS

- One row per variable value (e.g. 'Entry: MSS', 'Structure: Discount', 'Dxd: NOT taken').
- Columns: Trades, Win %, Avg R, P&L;, Profit Factor, Max Drawdown, Expectancy.
- Sortable by any column; default sort by P&L.; Negative-P&L; variables flagged red.

DATA REQUIRED

- Per-trade: all tagged attributes + outcome metrics

BENEFIT

Before exploring combinations, the trader sees which single variables carry their edge and which quietly cost money — e.g. 'Dxd: NOT taken' bleeding -\$264K is an immediate, actionable finding.

Flat ranking of every single tag variable

PATTERNS & BEHAVIOR

Trade Flow (Setup to Tag)

Setup to outcome to tag flow ribbons

PURPOSE

A flow diagram tracing trades from their setup type, through their outcome, to their post-trade tag. Shows visually where trades 'leak' from good setups into bad outcomes.

HOW IT WORKS

- Left nodes = setups (FVG, OB, MSS); middle = Win/Loss; right = post-trade tags.
- Ribbon width is proportional to the number of trades following that path.
- Thick red ribbons flowing from a good setup into 'Stopped' or 'Early Exit' = where edge is lost.

DATA REQUIRED

- Per-trade: setup_tag, outcome, dominant post-trade tag

BENEFIT

No competitor journal has this. It answers 'where do my good setups go wrong?' at a glance — a fat ribbon from FVG -> Loss -> Early Exit instantly shows a management problem isolated to one setup, which tables of numbers bury.

PATTERNS & BEHAVIOR

Edge Finder

PURPOSE
Auto-detected statistical patterns surfaced as ranked, plain-language insights with their P&L; impact.

HOW IT WORKS

- Scans subgroups (session/symbol/hour/day/tag) for significant deviations from baseline.
- Requires a minimum sample (≥20 trades) and a significance threshold (95%).
- Each insight is clickable to view its underlying trades and apply it as a filter.

DATA REQUIRED

- Per-trade full fields for subgroup aggregation + significance testing

BENEFIT
Acts as an automated analyst. Most traders sense they have patterns but cannot prove them; Edge Finder states them concretely: 'After two consecutive losses your next-trade win rate drops to 38%.'

Ranked detected patterns with P&L; impact

PATTERNS & BEHAVIOR

Behavioral Tilt Timeline

Composite tilt indicator over time

PURPOSE
A composite tilt indicator over time — built from position-size deviations, trade-frequency spikes, and post-loss behavior — with spikes flagged.

HOW IT WORKS

- Line/area rises when behavior deviates from the trader's baseline.
- Spikes are annotated with date and context (e.g. a revenge-trading cluster).

DATA REQUIRED

- Per-trade size, timestamps, sequence relative to losses

BENEFIT
Makes an emotional state measurable. Seeing tilt spike right after drawdowns helps the trader recognize and interrupt the pattern before it does real damage.

PATTERNS & BEHAVIOR

Execution & Rule Adherence

PATTERNS & BEHAVIOR

Price Behavior Explorer

STANDARD

PROP FIRM

LIVE JOURNAL

STRATEGY (MERGED)

Average price paths around entry (win/loss/median)

PURPOSE

How price moves before and after entry, averaged into winning, losing, and median paths around the entry marker.

HOW IT WORKS

- X = candles since entry (negative before, positive after); Y = % move from entry.
- Green = avg winner path, red = avg loser path, blue = median; faint individual paths optional.
- Reference lines at avg MFE peak, avg exit, avg MAE trough.

DATA REQUIRED

- Per-trade pre/post entry price path arrays

BENEFIT

Shows the trader the typical anatomy of their trades: if winners ramp sharply in the first few candles then stall, that argues for earlier partial profit-taking.

PATTERNS & BEHAVIOR

Market Regime Matrix

PURPOSE
A 3×3 grid of trend (up/down/range) against volatility (low/normal/high), each cell showing expectancy/win rate for trades in that regime.

HOW IT WORKS

- Rows = trend state, columns = volatility state.
- Cell value = expectancy in R, colored by performance.
- Regime tagged at entry from ADX (trend) and ATR (volatility).

DATA REQUIRED

- Per-trade marketRegime tag {trend, volatility, session}

BENEFIT
Reveals whether the edge is universal or regime-dependent. Many strategies only profited because the market sat in their preferred regime — this exposes that dependency before it costs money.

Trend × volatility regime expectancy grid

STRATEGY HEALTH

Edge Decay

STANDARD	PROP FIRM	LIVE JOURNAL	STRATEGY (MERGED)
----------	-----------	--------------	-------------------

Expectancy-over-time with break-even line

PURPOSE
Smoothed expectancy over time against a break-even line, with markers at rule or regime changes — is the edge improving, stable, or eroding?

HOW IT WORKS

- Expectancy curve over the trade history.
- Gold break-even reference line; vertical markers at known changes.
- Companion stability cards: win-rate, profit-factor, Sharpe stability, edge half-life.

DATA REQUIRED

- Per-trade expectancy time series + change-event timestamps

BENEFIT
Critical for any strategy past ~100 trades. Catching a decaying edge early lets the trader adapt or retire the strategy before a slow bleed becomes a large loss.

STRATEGY HEALTH

Position Sizing (Optimal F)

Optimal F growth curve with Kelly markers

PURPOSE
The expected growth-rate curve across position sizes, marking the trader's actual size, full Kelly, and half-Kelly.

HOW IT WORKS

- X = risk % per trade; Y = expected growth rate.
- Markers for Half-Kelly, Kelly, and the trader's actual sizing.
- Companion: drawdown trade-off ('Half-Kelly = 80% of growth at 40% of drawdown').

DATA REQUIRED

- Per-trade win rate, avg win, avg loss, actual risk %

BENEFIT
Position sizing is where positive-expectancy traders still blow up. Optimal F shows the math; the half-Kelly marker makes the case for sizing well below the theoretical peak to survive variance.

STRATEGY HEALTH

Sequence Risk

- STANDARD
- PROP FIRM
- LIVE JOURNAL
- STRATEGY (MERGED)

PURPOSE
Shuffles the trade order thousands of times to show how dependent the actual drawdown was on luck-of-sequence, plus path-dependency and bad-streak probabilities.

HOW IT WORKS

- Distribution of max drawdowns across 1000 reorderings; line at the actual max DD.
- Path-dependency test: what if the worst trades had come first?
- Bad-streak probability table (P of 3, 5, 7, 10 losses in a row).

DATA REQUIRED

- Per-trade outcome set (order-independent)

BENEFIT
Reveals how lucky the actual trade order was. If the real drawdown sits at the favorable end of the reorder distribution, the trader should expect deeper drawdowns ahead and size accordingly.

PROP CHALLENGE (prop-aware)

Challenge Configurator

STANDARD

PROP FIRM

LIVE JOURNAL

STRATEGY (MERGED)

PROP CHALLENGE CONFIGURATOR

ASSET CLASS

FuturesForex

STRUCTURE

1-step2-stepInstant

FIRM PRESET

FTMOApexTopstepCustom

Account: \$50,000

Min Days5

PHASE 2

Profit Target5%

Daily Loss5%

Max DD10% trailing

Min Days5

Challenge setup: 1-step/2-step, futures/forex, per-phase rules

PURPOSE
The setup panel that defines a prop evaluation and turns the rest of this category on. Available in every mode — a Standard or Strategy user configures a challenge ad hoc; a Prop user sees it pre-filled; a Live prop account auto-activates it.

HOW IT WORKS

- Asset class (Futures / Forex), structure (1-step / 2-step / Instant), firm preset (FTMO / Apex / Topstep / Custom), account size.
- Per-phase rule cards: profit target, daily loss, max drawdown + drawdown type (static / trailing / EOD-trailing), min/max days.
- Futures presets default to trailing/EOD drawdown; forex to static. 2-step exposes Phase 1 + Phase 2 separately.
- Saving writes session.propChallenge and activates Rule Compliance, Pass Probability, Variation Optimizer for the current source.

DATA REQUIRED

- session.propChallenge (assetClass, structure, firmPreset, accountSize, phases[], drawdownType, toggles)

BENEFIT
Lets any mode test against any firm's exact rules. This is what makes the prop tooling usable from Standard and Strategy, not just Prop mode — the user models the precise evaluation they intend to attempt.

PROP CHALLENGE (prop-aware)

Rule Compliance & Utilization

- STANDARD
- PROP FIRM
- LIVE JOURNAL
- STRATEGY (MERGED)

Rule utilization timeline with limit lines (phase-aware)

PURPOSE

A per-rule compliance tracker plus a utilization timeline showing daily loss budget, drawdown headroom, and profit-target progress across the evaluation. Phase-aware for 2-step; respects the configured drawdown type.

HOW IT WORKS

- Status banner PASS/FAIL/IN-PROGRESS with the failing rule, date, and phase.
- Per-rule table: status, worst day, closest call, breaches, margin.
- Stacked utilization timeline: daily loss used, DD headroom (static vs trailing vs EOD-trailing), target progress.
- Sub-window: rule sensitivity ('if daily limit were 4% instead of 5%, fails on day 7') + near-miss heatmap.

DATA REQUIRED

- session.propChallenge + propFirmStatus
- Per-day aggregation; running-peak engine per drawdown type

BENEFIT

Makes prop rules first-class. The trader sees exactly which days came close to a breach — invisible on a normal equity curve — and how sensitive the outcome is to each rule and to the static-vs-trailing drawdown convention.

PROP CHALLENGE (prop-aware)

Pass Probability & Simulation

STANDARD

PROP FIRM

LIVE JOURNAL

STRATEGY (MERGED)

PASS PROBABILITY

PURPOSE

A radial gauge of the probability the strategy passes a fresh evaluation, with failure-cause breakdown, preset comparison, and a 1-step-vs-2-step combined probability.

HOW IT WORKS

- Large gauge = overall pass probability from Monte Carlo over the configured rules.
- Failure-cause ring: daily loss / max DD / missed target / min days / consistency rule.
- Preset comparison (FTMO / MyForexFunds / The5ers / FundedNext / Topstep / Apex) side by side.
- 1-step vs 2-step toggle shows combined $P(\text{phase1}) \times P(\text{phase2} \mid \text{phase1})$. Scenario sliders re-run live.

DATA REQUIRED

- session.propChallenge
- Monte Carlo worker over the trade distribution; per-phase simulation

BENEFIT

A strategy can pass one backtest by luck yet show only a 47% pass probability. This tells the MENA prop trader the truth before they pay for an evaluation — and the preset comparison shows which firm to choose.

Pass-probability gauge + preset + 2-step simulation

PROP CHALLENGE (prop-aware)

Variation Optimizer

PURPOSE
Shows which variations reach the goal — along two switchable axes: vary the STRATEGY (risk %, TP/SL, session, setups) or vary the CHALLENGE (firm, account size, 1-step/2-step, futures/forex), or both as a grid.

HOW IT WORKS

- Pass-probability heatmap: rows = variations, columns = challenges; gold stars mark cells above the pass threshold.
- Vary Strategy: sweep parameters from the Strategy Builder + filters, re-simulated against the rules.
- Vary Challenge: hold the strategy fixed, find which evaluations it could realistically pass.
- Sortable results table + 'best variation' callout. Worker-backed with grid-size caps.

DATA REQUIRED

- Strategy Builder parameters + dashboard filters
- variationOptimize worker: cartesian sweep re-simulated vs rules

BENEFIT
Answers the two questions the trader actually has: 'what do I change to pass?' and 'which challenge should I even attempt?'. Pulling parameter ranges from the Strategy Builder ties the whole platform together.

Pass-probability heatmap across strategy × challenge variations

PROP CHALLENGE (prop-aware)

Daily Limit Optimization

Dual daily-limit sliders with original-vs-optimized

PURPOSE

An interactive discipline simulator. Set an upper daily profit target and a lower daily loss limit, then re-walk the entire history: once a day crosses either limit, the rest of that day's trades are skipped. (Adopted from last year's standout idea.)

HOW IT WORKS

- Two sliders: daily profit target and daily loss limit (in % or \$).
- Re-simulates day by day, stopping each day at the first limit crossed.
- Original vs Optimized panels: Total P&L;, Win Rate, Improvement %, Days Saved, Risk Reduction %.
- Most powerful with a configured challenge; a lighter variant works in Standard too.

DATA REQUIRED

- Per-trade openTime (daily grouping), pnl_dollars_net, starting_balance
- Web Worker harness

BENEFIT

Most blown evaluations come from one bad day where the trader kept going past their limit. This quantifies how much a hard daily stop would have saved and how it lifts pass probability. No competitor has it.

LIVE DISCIPLINE (Live only)

Discipline Filter & Score

LIVE JOURNAL

Plan-adherence donut + discipline score

PURPOSE

Every live trade carries a plan-adherence tag — According to plan / Out of plan / Missed trade — set at journaling time. The view scores discipline from the distribution and trends it over time.

HOW IT WORKS

- Donut of the three adherence categories; enforced on import (untagged live trades flagged to classify).
- Discipline Score 0-100: according-to-plan rewarded; out-of-plan and missed-trade penalized.
- Missed-trade penalty weighted by the R the plan would have produced.
- Score-over-time trend line.

DATA REQUIRED

- Per-trade planAdherence ('according-to-plan' | 'out-of-plan' | 'missed-trade')
- hypotheticalRr for missed-trade rows

BENEFIT

Discipline is the single biggest determinant of whether a profitable backtest survives a live account. This makes it measurable — and is the input to the actual-vs-strategy comparison.

LIVE DISCIPLINE (Live only)

Demon Catcher

LIVE JOURNAL

Demon arena: cards sized by frequency + boss spotlight

PURPOSE

Talaria's take on Tom Dante's Demon Finder: track how often the trader commits each common error ('demon'), find the one outpacing the rest, and kill it first. Rendered as a visual 'arena', not a spreadsheet.

HOW IT WORKS

- Each demon is a card sized/intensified by how often it's committed — the worst looms largest and glows red.
- A 'boss to slay next' spotlight highlights the most-active demon; a health bar fills as it recurs.
- A demon that goes N trades without recurring fades and is marked 'slain'. 8-in-a-row triggers a deeper-issue warning.
- A Survival → Growth → Consistency → Profitability rail frames the view (Dante's ladder). Demons editable in settings.

DATA REQUIRED

- Per-trade demons[] (errors committed)
- session.demonLog rollup

BENEFIT

Discipline tools are usually dull spreadsheets traders abandon. Gamifying it — a boss to beat, demons that visibly die — makes the habit stick, which is the whole point of Dante's method. Unique to Talaria among journals.

LIVE DISCIPLINE (Live only)

Plan-Adherence Equity

LIVE JOURNAL

Actual vs strategy equity with deviation-cost gap

PURPOSE

Two overlaid equity curves — Actual (what the trader realized) vs Strategy (what perfect adherence would have produced) — with the gap quantified as the dollar cost of deviations.

HOW IT WORKS

- Strategy curve includes missed-trade hypothetical R and excludes out-of-plan trades.
- Shaded gap = the cost (or benefit) of the trader's deviations.
- Stat cards: 'Deviations cost you \$X / Y R', 'Missed trades cost \$Z', 'Out-of-plan net \$W'.

DATA REQUIRED

- Per-trade planAdherence, pnl_dollars_net, hypotheticalRr

BENEFIT

Turns discipline from an abstraction into a dollar figure — the most motivating possible feedback. A trader who sees 'your deviations cost \$4,200 this quarter' changes behavior fast.

STRATEGY SOURCE (Strategy only)

Source Reconciliation

STRATEGY (MERGED)

Member coverage bars + conflict resolution panel

PURPOSE

The control room that makes merged multi-source data valid before any cross-source view renders. Handles different tag vocabularies, instruments, date ranges, account scales, and currencies.

HOW IT WORKS

- Member list with date-range coverage bars; choose union / intersection / custom date mode.
- Tag-mapping and instrument-mapping tables (raw → canonical); unmapped items flagged.
- Scale normalization (R-multiple / % / none) with a mismatch warning; currency handling.
- Conflict panel lists every unresolved issue; cross-source views degrade gracefully until resolved.

DATA REQUIRED

- session.mergedSources (members, tagMap, instrumentMap, dateRangeMode, normalization, conflicts)

BENEFIT

Merging a \$10k backtest, a prop eval, and a live account naively produces nonsense. This layer is what makes the Strategy source trustworthy instead of misleading — it never shows wrong numbers, it shows a 'resolve this first' banner.

STRATEGY SOURCE (Strategy only)

Source Attribution Breakdown

STRATEGY (MERGED)

Source contribution + backtest-vs-live divergence

PURPOSE
Decomposes any aggregate by originSource and compares the same strategy across sources to reveal backtest-vs-live divergence.

HOW IT WORKS

- Stacked contribution bar: 'of +\$8,340 net — Standard +X, Prop +Y, Live +Z'.
- Backtest-vs-live divergence: overlay the normalized equity curves of the same strategy from different sources.
- Per-source mini KPI cards.
- Reads reconciled / normalized values from the reconciliation layer.

DATA REQUIRED

- Per-trade originSource
- Reconciled + normalized values from Source Reconciliation

BENEFIT
Answers 'where did my edge actually come from?' and 'does my live execution match my backtest?'. The divergence view ties directly into the Discipline score — a big gap means execution, not the strategy, is the problem.

PDF/HTML/img

PREVIEW

live

as you pick

PURPOSE
Builds a custom export from any combination of dashboard views, with templates, granular card selection, cover options, and a live preview.

HOW IT WORKS

- Templates: Mentor Review, Prop Firm Application, Self-Review, Custom.
- Page- and card-level checkboxes; cover page options; PDF/HTML/image output.
- Live preview pane renders the report as configured.

DATA REQUIRED

- Read access to all rendered views + serialization to a document

BENEFIT
Lets a trader send a clean analysis to their mentor (Hermes) in one click, or assemble a record for a prop firm application — without manual screenshotting.

Report builder controls (template / pages / format)

EXPORT

Comparison View

STANDARD

PROP FIRM

LIVE JOURNAL

STRATEGY (MERGED)

Two-session comparison with delta and overlay

PURPOSE

Side-by-side comparison of two sessions with a per-metric delta column, overlaid equity curves, diff heatmaps, and a significance indicator.

HOW IT WORKS

- Pick Session A and Session B (e.g. Standard vs Prop Firm of the same strategy).
- Middle delta column shows the difference for every metric, color-coded.
- Overlaid equity curves; time-of-day and weekday diff heatmaps.
- Statistical significance (p-value) on the expectancy difference.

DATA REQUIRED

- Two session objects + paired statistical test

BENEFIT

The most powerful comparison tool: see what prop firm rules cost the same strategy, A/B two strategies on identical conditions, or detect improvement/decay across two periods.
